

PENETRATION TESTING

Experience custom testing tailored to your technology stack and business logic. Our Yetis act as an extension of your security team, operating as real attackers to find unique vulnerabilities that automated tools overlook. They deliver actionable insights into your organization's true security posture.

REAL WORLD ATTACK SIMULATIONS

- **External Perimeter Assessment:** Examines your public-facing defenses to help ensure granular, protocol-specific policies are followed.
- **Internal Testing (No Credentials):** Simulates an attacker obtaining access without valid login credentials (e.g., by connecting to a rogue device or unsecured Wi-Fi in a parking lot) to evaluate internal network segmentation and controls.
- **Compromised Insider Simulation:** Portrays a day one employee with standard credentials, revealing what a compromised internal account can achieve by using only existing system capabilities (a.k.a. "living off the land").

BLENDED RISK MODEL APPLICATION

- **Impact:** We answer "How bad will it hurt?" based on your critical assets and losses, such as PII exposure and financial fines.
- **Likelihood:** Assesses access boundaries, safeguards, and attack complexity.
- Our process aligns with NIST standards (NIST 800-37, 800-53, 800-115, 800-171) for thorough assessment.

KEY

DIFFERENTIATORS

Actionable Partnership:

We do more than list vulnerabilities. We explain each risk in the context of your environment, provide clear recommendations, and ensure your team understands the results.

Deep Analysis, Not Just

Button-Pushing: We go beyond automated testing to perform deep analysis, providing thorough write-ups that consider client-specific factors and investments in security.

Blended Risk Methodology:

We rely on the NIST SP 800 series framework, using its Impact x Likelihood approach to define risk. This recognized standard gives you confidence in our assessments and supports your leadership in making informed decisions about compensating controls.

[CONFIDENTIAL]

Yeti is a creature of legend, powerful yet unseen. Your most critical vulnerabilities can be just as elusive. We use various testing methodologies to peel back the layers of your security defenses, one by one, uncovering hidden weaknesses and providing a comprehensive view of your exploitable attack surface.

COMPREHENSIVE TESTING SCOPES

Penetration Test: Actively exploits identified vulnerabilities to demonstrate the real-world impact and extent of a potential breach.

Vulnerability Assessment: Identifies and prioritizes security weaknesses so you can address risks before they're exploited.

TAILORED ENGAGEMENT

Instead of reviewing typical white, gray, or black "box" methodologies, we listen to truly understand your 'five minutes before a holiday weekend' security fears. This approach gives us sharper insight into your needs, ensuring our evaluation delivers maximum value and uncovers vulnerabilities that other firms might overlook.

We simulate external attackers with zero prior knowledge to reveal risks far beyond a simple perimeter check. We also emulate adversaries with limited system access—such as a compromised user account or a malicious insider—to assess potential internal impact. Throughout the engagement, our open-book approach keeps your team informed as we identify and prioritize key concerns. Our methodology is never rigid—it's tailored to your environment and goals.

WHAT TO EXPECT

Proactive Transparency: We keep you informed throughout testing, avoid surprises, and flag high-risk issues right away. Critical vulnerabilities trigger immediate contact and support for mitigation.

Positive Observations: We enjoy delivering good news just as much as identifying risk! We provide detailed reports on attempted exploits and the measures that successfully blocked us, validating your security investments.

Feel Empowered: We partner and collaborate with your team to enhance your security posture, ensuring you understand the findings and their implications without causing undue panic.
